

Verifying Wireless Settings are Delivered via GPO

Windows XP

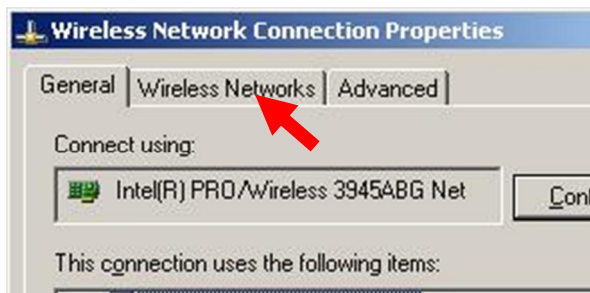

Right click the wireless icon in the systray and click "View Available Wireless Networks"

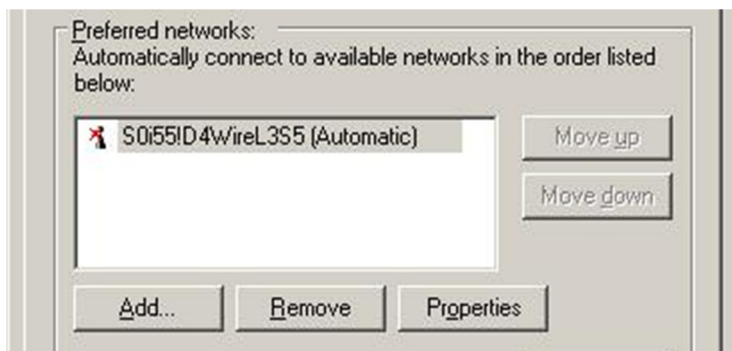

In the next window, click "Change advanced settings"

Click on the "Wireless Networks" tab

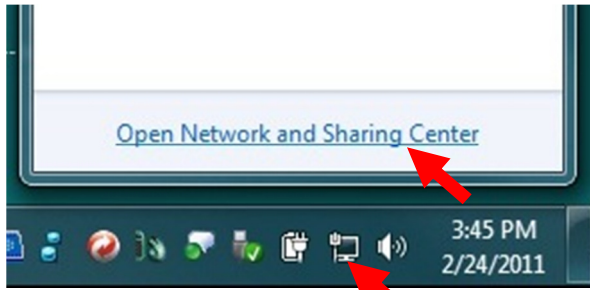

If you see the wireless profile in the "Preferred networks" box, the settings have been delivered via GPO or manually configured by an operator or end user. A GPO delivered profile is not end user configurable.

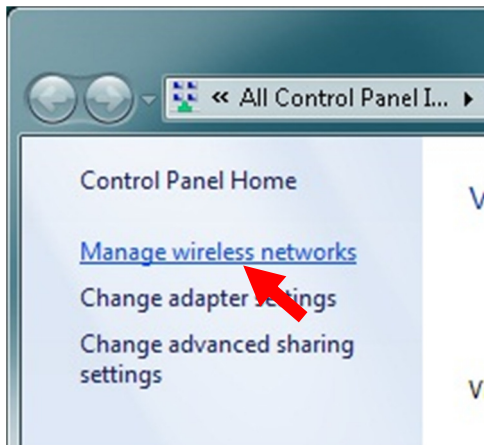

Windows 7 (Vista)

Click the network icon in the systray and click “Open Network and Sharing Center”

Click “Manage wireless networks”

The wireless networks listed under “Networks you can view” are delivered via GPO and are not end user configurable. The wireless networks under “Networks you can view, modify, and reorder” are manually configured by an operator or an end user.
